

## **PRODUCT DESCRIPTION**

UV105 provides the following product characteristics:

Technology	Acrylic
Chemical Type	Acrylated urethane
Appearance (uncured)	Transparent liquid
Components	One component - requires no mixing
Viscosity	Low
Cure	Ultraviolet (UV)/ visible light
Cure Benefit	Production - high speed curing
Application	Bonding
Flevihility	Enhances load bearing & shock absorbing characteristics of the
	bond area.

UV105 is primarily designed for bonding rigid or flexible PVC to polycarbonate, while not inducing stress cracking under typical molded stress levels. It enables easy assembly of components with close fitting tolerances (i.e.joining polycarbonate to flexible PVC tubing), and is recommended for applications involving small gaps less than 0.25mm. It has also shown excellent adhesion to a wide variety of substrates including glass, many plastics and most metals. Suitable for use in the assembly of disposable medical devices.

## **TYPICAL CURING PERFORMANCE**

UV105 can be cured by exposure to UV and/or visible light of sufficient intensity. To obtain full cure on surfaces exposed to air, radiation @ 220 to 260 nm is also required. The speed of cure will

depend upon the UV intensity and spectral distribution of the light source, the exposure time and the light transmittance of the substrates.

## **Stress Cracking**

Liquid adhesive is applied to a medical grade polycarbonate bar 6.4 cm by 13 mm by 3 mm which is then flexed to induce a known stress level.

Stress Cracking, AST	M D 3929, minutes:
----------------------	--------------------

7 N/mm <sup>2</sup> stress on bar	>15
12 N/mm <sup>2</sup> stress on bar	3 to 4

#### **Fixture Time**

Fixture time is defined as the time to develop a shear strength of 0.1  $\ensuremath{\text{N/mm^2}}$  .

UV Fixture Time, Glass microscope slides, seconds:	
Black light, Zeta ® 7500 light source:	
6 mW/cm <sup>2</sup> , measured @ 365 nm	≤15
UV Fixture Time, Polycarbonate, seconds:	
Metal halide bulb:	
30 mW/cm <sup>2</sup> , measured @ 365 nm,	<5
Electrodeless, H & V bulbs:	
50 mW/cm <sup>2</sup>	<5
Electrodeless, D bulb:	
50 mW/cm <sup>2</sup>	<5

## Depth of Cure vs. Irradiance (365 nm)

The graphs below show the increase in depth of cure with time at 30 mW/cm<sup>2</sup> - 100 mW/cm<sup>2</sup> as measured from the thickness of the cured product formed in a 9.5mm trough.

**Note:** When exposed to a V Bulb at irradiances of 50 and 100 mW/cm<sup>2</sup> for 30 seconds, a depth of cure greater than 13 mm was achieved. The performance for medium pressure Hg will be similar to Electrodeless system, H bulb
